Intex krystral clear sand filter pump replacement motor

The fuel pump in the Dodge Caravan is mounted inside the fuel tank like many other vehicles. You need to detach the tank from the van to remove and replace the pump module, but the job is simpler than on many other vehicles. This fuel pump also contains its own filter – sometimes called a strainer – that might need replacing. You can replace the fuel pump module, the filter or both if needed. Start the van's engine. Open the fuel cap and remove the fuel pump relay from the engine's fuse box. Look for the engine to stall, signaling that the fuel pressure is gone. Disconnect the van's negative battery cable. Unbolt the fuel tank's straps and lower the tank just enough to access the fuel pump flange. You can have a second person lower the tank, but it might be easier to use a floor jack with a wood block. Remove the small locking pin on the pump's electrical connector with needle-nose pliers, and disconnect the electrical connector. Press the retainer tabs on the fuel lines and disconnect them from the pump. Unscrew the pump's locking ring with a strap wrench or a similar hand-made tool that can grip the large ring and turn it. Pull the water pump out of the tank, then remove and discard the O-ring from the fuel tank. Pry back the locking tabs connecting the inlet filter to the pump reservoir using a thin screwdriver and remove the filter. This is only needed if this filter is in good condition and you must transfer it to the new pump. Lubricate the O-ring for the filter with engine oil and connect it to the outlet of the filter. Push the filter onto the pump reservoir's inlet and make sure the locking tabs engage. Install a new O-ring onto the seating hole on the fuel tank. Insert the pump module into the tank, tilting it at an angle and making sure you don't damage the filter or the pump float. Make sure the module is properly seated. Screw the retaining ring into position on the pump module. Reconnect the fuel lines to the pump using their quick-connect fittings and the electrical connector with its locking pin. Connect the tank back to the van using its straps and strap bolts. Reconnect the fuel pump relay and negative battery cable. £0.00 (Price shown includes 20% VAT. - Excludes delivery costs) Item no.: SB-110747, Content: 1 Pcs, EAN: n/a | SKU: {{ part.sku }} {{ part.name }} Total parts to replace: {{ part.parts_qty }} There are no products listed under this category. There are no FAQs listed under this category. If leaves and gravel are ruining your relaxing swim, it's time to filter your pool. A sand filter is an effective choice for cleaning the water, and it may reduce the amount of chemicals you need to use. Here's how a pool sand filter works. What Is a Pool Sand Filter? A pool sand filter is a filter that uses natural sand, ground to a diameter of approximately 50 millimeters. This specially produced type of sand is called "#20 silica," and retailers often sell it as "filter sand" or "pool sand." The filter draws water through a bed of sand, sifting out debris. Sand filters are a popular choice as they use natural materials and require only minimal maintenance to remain at optimal efficiency. What Does the Filter Do? The design of a sand filter is relatively simple, comprising a canister containing sand. A diffuser pulls water into the canister and down through the bed of sand where the debris collects. Clean water comes through the bottom of the sand, and a pump returns this water to the pool. A quick image search for "pool sand filter diagram" on Google presents a good selection of images that show the internal workings of the system and how it uses the natural filtering properties of the sand to maintain your pool water. Inground or Above Ground Filters? Sand filters fall into two main categories: Those designed for inground pools and those designed for above-ground pools. The main difference is the size, with the inground models generally being capable of handling much larger volumes of water and stronger pump flows. Keep in mind that pool sand filter sizing is essential for efficient and safe operation, so always check the filter specifications against your pool size, and ensure the filter is capable of cycling the entire pool in approximately eight hours. In most cases, only very small inground pools are compatible with above-ground filters, so do your research before making a purchase. How Effective Are Sand Pool Filters? Sand filters are effective at removing large debris such as insects and leaves, and they are quite effective for smaller particles greater than approximately 40 microns. Even smaller particles may end up trapped in the filtration system, especially as the water continues to cycle. Filtering water through sand minimizes the amount of chemicals necessary to keep the water clean, but you may still need a chlorine feed system for chlorine water treatment to kill bacteria and reduce mildew. What Maintenance Is Required? One of the main benefits of a pool sand filter is the minimal amount of maintenance necessary. The accumulation of debris in the sand is actually a good thing as it improves filtration. Over time, however, it also causes pressure to build up. When you notice pressure in the filter has increased by around 10 pounds, perform a "backwash" cycle following the filter's user instructions carefully. Additionally, it's necessary to replace the sand in the system once every five years or so. MORE FROM QUESTIONSANSWERED.NET Airbeds & Furniture Pools Toys & Floats Sporting Goods Pumps Replacement Parts Prime refers to a state where air has been purged from the swimming pool water pump, which allows the filter pump to move pool water. When your pump loses its prime, it is no longer pumping water. These tips will help you get the prime back in your swimming pool water pump and filter system. This may seem like an obvious first step, but remember that the pump is an electrical system. You would not attempt to replace a light—or do any electrical work—without hitting the off switch. Use the same caution with your pool's pump. But, simply turning off the pump requires a few steps. Close all valves on the suction side of the pump. This includes the main drain, skimmer, and vacuum lines. If you have an air relief valve on your filter, open it to release any built-up pressure. Slowly open the strainer lid of the pump. If you do not have an air relief valve, open the strainer lid a little to let the pressure bleed off. Inspect the hair/line strainer basket and clean it out if necessary. Ensure that the basket is in good shape and is not distorted or broken. If it is damaged, you may need to check the impeller of the pump to ensure that there is no debris in it. If needed, replace the basket to avoid damaging the pump. Inspect the gasket or O-ring for the strainer top to ensure that it is clean and in good shape so that it will create a good seal. Replace the basket and fill the strainer with water using a bucket or garden hose. Replace the strainer lid ensuring that it seals tightly. If you have knobs to tighten, tighten them evenly using only your hands. Do not use a wrench or other tool as you may overtighten causing the knobs to distort or break. If your lid screws down, hand-tighten it. Turn on the pump first, then slowly open one suction-side valve only. Wait for the pump to catch its prime and get a good flow of water going. Let the pump sit for about 30 seconds to a minute. Close the valve first, then turn off the pump. Reopen the strainer, bleeding off pressure by opening the air relief on the filter or slowly opening the strainer lid to allow the pressure to escape. Refill the strainer with water, close the lid, turn on the pump and open the same valve. Repeat these steps several times as needed until you purge all of the air from that line and get the water moving. Once you have the water flowing through one line, slowly open the next valve on the suction side. Listen for the air to be pulled out of the line. If the pump starts to lose its prime, close the valve quickly. Continue to bleed the air out of the line as needed. Repeat this with any other lines. If you often lose the prime when turning off your pump, release the air in the filter first—if you have an air relief valve—before turning off the pump. Close the suction-side valves before opening the strainer lid. This will help to hold the water up to the valve and make repriming easier. £12.49 € (Price shown includes 24% VAT. - Excludes delivery costs) Item no.: SB-110747, Content: 1 Pcs, EAN: n/a
